

Pyroguard Balustrades Guidance

Behaviour in the event of breakage...

Pyroguard can confirm that in the event of one of the toughened glasses breaking in the fire-resistant glass balustrade panel, the fragments of glass will stay adhered to the interlayer and will not fall off. This can be seen clearly in Figure 1. However, the panel should still be replaced immediately.

Under normal circumstances the unit itself will maintain rigidity, such that it will not collapse out of the balustrade construction under its own weight.

In essence, the behaviour is very similar to that seen with polyvinyl butyral-laminated balustrade panels.
